Hunters have a relationship with rural communities as well as wildlife, and they highly value both. The habitat and wildlife are a common bond that benefits the hunter, and the rural people that need each other.

Regulated hunting benefits the people living in CBNRM areas by generating revenues, and by job creation, game meat distributions, voluntary contributions from hunting operators and clients, and development of "multiplier" industries (e.g., taxidermy, transport). Voluntary contributions from hunting operators and clients include, among other things, construction of schools, donation of school supplies, and payment of school fees; construction and electrification of clinics and funding for mobile clinic units; construction or rehabilitation of water infrastructure; provision of or funding for drought-relief food supplies; funding and transport for sports teams; support for local governments; and much more. For these reasons, a recent study of communal conservancy residents in Namibia found that "an overwhelming majority (91%) of respondents stated they would not be in favor of a ban on trophy hunting, and only 11% of respondents believe their community would continue to support or strongly support wildlife on communal lands if a ban were in fact enacted." In other words, 89% of respondents would not support wildlife on their land without the incentives generated from regulated hunting. According to the survey results, "[m]ost respondents strongly agreed that trophy hunting provides benefits to communities and were happy with it taking place on communal lands." The authors noted: "Results from elsewhere in Africa also suggest that where tangible benefits are received ... from hunting, local communities have more favorable attitudes towards wildlife." As demonstrated in the above table, local communities benefit significantly from hunting revenues and other incentives.

CBNRM programs benefit wildlife by increasing the amount of habitat for wildlife; reducing poaching through community game scouts, resource monitors, and incentives; and incentivizing greater tolerance among rural communities. As the U.S. Agency for International Development has recognized, Namibia's communal conservancies "have contributed to the widespread and well-documented recovery of wildlife in Namibia's communal lands, particularly in the semi-arid northwest, including rare or endangered species such as elephants, rhinos, and lions." In Tanzania, "WMAs represent the best hope for conserving wildlife outside of Tanzanian protected areas while enhancing rural economic development ... Safari hunting provides a valuable source of revenue for WMAs, especially in areas that are less attractive for photographic tourism. Having an abundance of animals to hunt is a direct benefit of conserving wildlife resources. The more wild animals the WMA manages and conserves, the more revenue it can generate. These are very tangible benefits and linkages that can be easily understood at the community level and are good incentives to reduce poaching and retaliatory killings of animals such as lions."

The U.S. Fish and Wildlife Service has acknowledged the importance of CBNRM in enhancement findings and other documents. For example: "Conservation programs that generate direct benefits to the local people are often regarded as the only truly effective means to implement lasting conservation measures."

Similarly, Russell Train, the chair and founder of WWF-US, emphasized the importance of CBNRM and the benefits generated by regulated hunting in stating "elephant hunting provides 'the most efficient and cost-effective form of producing economic benefits for local people that you can find."

For these reasons, the International Union for Conservation has concluded: "[L]egal, well-regulated trophy hunting programmes can – and do – play an important role in delivering benefits for both wildlife conservation and for the livelihoods and wellbeing of indigenous and local communities living with wildlife ... [W]ell-managed trophy hunting ... can and does generate critically needed incentives and revenue for government, private and community landowners to maintain and restore wildlife as a land use and to carry out conservation actions (including anti-poaching interventions). It can return much needed income, jobs, and other important economic and social benefits to indigenous and local communities in places where these benefits are often scarce. In many parts of the world indigenous and local communities have chosen to use trophy hunting as a strategy for conservation of their wildlife and to improve sustainable livelihoods ... Communities benefit from trophy hunting through hunting concession payments or other hunter investments, which typically support improved community services like water infrastructure, schools and health clinics; gaining jobs as guides, game guards, wildlife managers and other hunting-related employment; and gaining access to meat. These are typically poor rural communities with very few alternative sources of income and sometimes no other legal source of meat."
